

1) What The Codebase Does

- Delivers a student resilience experience with journaling and guidance.
- Frontend includes pages for Echo journaling, peer navigation, resilience pathways, blog, and support-oriented content.
- Supports retrieval-augmented guidance via a generated RAG index.
- Includes a backend HTTP service currently focused on health checks and API extension readiness.

2) Architecture and Organization

- Monorepo with npm workspaces:
 - apps/frontend (Next.js 14, TypeScript, Tailwind)
 - apps/backend (Node.js HTTP service)
 - content/blog (Markdown content source)
 - docs (architecture, algorithms, contracts)
- Clear separation between UI, content, docs, and services.

3) Engineering Quality Signals

- Root scripts define consistent checks: lint, typecheck, test, build.
- Automated frontend + backend test execution from root workspace.
- Production deployment guidance for Vercel, Netlify, and Docker.
- Architecture and feature docs are mature and easy to navigate.

4) Quick Assessment

- Organization: Strong (modular, well-documented, clear boundaries).
- Product maturity: Frontend-rich with strong content and UX surface.
- Backend maturity: Lightweight today; structured to scale APIs/jobs.
- Maintainability: Good due to workspaces, scripts, and docs quality.
